3. RESEARCH ACTIVITY

3A. Research Interests

Focus on the experimental and theoretical investigation of the optical, vibrational and electronic properties of advanced materials with emphasis on novel allotropes of carbon such as fullerenes, carbon nanotubes and graphene, which are essentially the main building blocks for the development of nanotechnology. Basic component of the research is the understanding and manipulation of materials properties. This can be achieved either physically by varying an external parameter like temperature, pressure, mechanical strain/stress or chemically by modifying the chemical composition or decorating the graphitic surfaces of carbon nanomaterials.

– Current research activities

During the last seven years focused on the experimental and theoretical investigation of properties such as vibrational, electronic, optical and mechanical of graphene nanostructures (single-, bi-, tri- and multi-layer graphene) and various two-dimensional crystals (BN, MoS₂, WS₂). Also, special attention has been paid in the investigation of embedded two-dimensional materials of atomic thickness into model polymeric nanocomposites as well as in the production of high volume fraction carbon nanotube nanocomposites based on the buckypaper approach. More specifically:

Material synthesis

1. Mechanical exfoliation of two-dimensional crystals. Large-area and high-quality graphene flakes (~ 200 μm).
2. Chemical vapour deposition technique for graphene and MoS₂ fabrication.
3. Application of transferring techniques such as PMMA, electrochemical, lamination of two-dimensional crystals onto different substrates (semiconducting, metallic, shape memory alloys, polymers).
4. Fabrication of thin sheets of carbon nanotubes (buckypapers) with adjustable porosity via the usage of various solvents.
5. Fabrications of high volume fraction carbon nanotube polymer nanocomposites with enhanced electrical and mechanical properties using the Resin Film Infusion method.

Optical spectroscopy of nanomaterials

1. Raman, photoluminescence and absorption under high hydrostatic pressures (0-30 GPa), as a function of temperature (1.8 - 900 K) and mechanical loading (uniaxial, biaxial).
2. Raman, Photoluminescence mapping and imaging.
3. Atomic Force Microscopy (AFM) in combination with Raman spectroscopy. Tip Enhanced Raman Scattering {in progress}.
4. Pump and probe Raman spectroscopy. Direct determination of the lifetime of G Raman active mode (related to the phono-phonon interactions) and its dependence on charge doping, number of layers, temperature and mechanical loading.

Study of the variation of vibrational, electronic and optical properties as well as the induced phase transitions (structural and electronic) of two-dimensional materials (graphene, BN, MoS₂, WS₂) under the influence of physical and chemical perturbations such as

1. Mechanical deformation (uniaxial, biaxial) and high hydrostatic pressure.
2. Axial compressive strain in model composites reinforced with two-dimensional crystals. Determination of critical buckling strain.
3. Temperature dependence (1.8 – 600 K).
4. Charge doping and chemical modifications.

Theory and simulations

1. Calculations of phonon properties (dispersion curves, density-of-states) using molecular dynamics and first principles methods.
2. Calculations of mechanical properties of graphene and boron nitride crystals and nanoribbons by means of molecular dynamics (LAMMPS Molecular Dynamics Simulator) and first principles.

Graphene and carbon nanotube nanocomposites

1. Mechanical behaviour of flexible graphene-based flat panel display.
2. Lithography of CVD graphene using ultra-short pulsed laser beams with application in optical memories (research grand GRAPHEVA).
3. Mechanical load transfer in polymer-nanoinclusion interfaces.
4. Raman mapping of stress or strain within polymer composites.
5. Influence of uniaxial and biaxial deformation in model polymer composites.
6. Mechanical and electrical response of high volume fraction carbon nanotube nanocomposites.

– Other research activities

In the past we have studied the optical, vibrational, electronic, structural, magnetic and superconduction properties of technologically important materials such as
